🎤 How to Face the Viva for Your Project

1. Start with the Purpose (High-level idea)

👉 Example Answer:
*"My project is a wellness app called **WellnesMate**. It helps users manage their daily health by tracking habits, logging moods, and reminding them to stay hydrated. The aim is to promote personal wellness through technology."*

---

2. Explain the Core Features (one by one)

a) Daily Habit Tracker

- Users can **add, edit, delete** habits (e.g., exercise, meditation).
- Shows **daily progress** with a progress bar or percentage.
- Data is saved in **SharedPreferences**.

👉 Viva line:
"In HabitsFragment, I used RecyclerView with a HabitsAdapter to display habits. Progress is saved using SharedPreferences and updated daily."

---

b) Mood Journal with Emoji Selector

- Users can log their **mood with emoji + notes**.
- Past moods shown in a list or chart.
- Supports **quick logging with shake detection**.

👉 Viva line:
"In MoodFragment, moods are stored as MoodEntry objects with emoji, timestamp, and optional notes. I also used MPAndroidChart to show weekly trends. Additionally, I used the accelerometer sensor so a quick shake adds a mood instantly."

---

c) Hydration Reminder

- Sends notifications reminding user to drink water.
- Implemented with **AlarmManager + BroadcastReceiver**.

- Handles reboot (BootCompletedReceiver) so reminders survive restarts.

👉 Viva line:
"Hydration reminders are scheduled with AlarmManager. HydrationAlarmReceiver shows the notification, and BootCompletedReceiver reschedules alarms after restart. The reminder settings and intake logs are saved in SharedPreferences."

---

3. Advanced Features (choose the ones you implemented)

- **Sensor Integration** → shake detection for mood quick entry.
- **Charts** → MPAndroidChart for mood trends.
- **Widget** → HabitProgressWidget to show today's progress on home screen.

👉 Viva line:
"For advanced features, I implemented both shake detection and MPAndroidChart. This adds interactivity and visualization, making the app more engaging."

---

4. Technical Implementation

- **Architecture** → Activities (Login, Main, Onboarding) + Fragments (Habits, Mood, Hydration, Settings).
- **Data Persistence** → SharedPreferencesManager (custom class to store habits, moods, hydration, user login).
- **Intents** → Explicit intents for navigation, implicit intents for sharing habit/mood summaries.
- **UI** → RecyclerViews, Data Binding, responsive layouts for portrait/landscape.

👉 Viva line:
"I followed modular design: each feature has its own Fragment, data is stored with SharedPreferencesManager, and UI is responsive across orientations."

---

5. Challenges & Solutions

Examiners often ask this.
👉 Examples you can say:

- *“Handling alarm scheduling on Android 12+ was tricky because of exact alarm permissions. I solved it by checking canScheduleExactAlarms() before rescheduling.”*
- *“Shake detection was sensitive at first. I adjusted the threshold value to reduce false triggers.”*
- *“SharedPreferences is simple but limited. I carefully structured keys and counts to handle multiple habits and moods.”*

---

6. Code Quality & Creativity

- Mention **clear naming, comments, modular code**.
- Point out creative features like widget, shake detection, chart.

👉 Viva line:
"I focused on clean code with proper naming and comments. For creativity, I added both a widget and shake gesture to make the app more interactive."

✅ **Tips to Answer in Viva**

- Always answer **what, how, and why**:
  - *What is this feature?*
  - *How did you implement it?*
  - *Why did you choose this method?*
- Keep answers short but clear (don’t over-explain unless examiner asks deeper).
- If you don’t remember exact code → explain logic/flow instead.
- If asked about **SharedPreferences vs Database**:
  👉 “I chose SharedPreferences because it’s lightweight and suitable for small structured data like habits and moods.”
